

human brain is perfect

I don't mean that it's because it can solve every differential equation correct.

I mean, I love its chaos and sometimes have no clues to predict.

someone says computer is electronic brain,

I don't believe that bullshit.

computer is too "perfect" to be perfect like brain.

you can trace back every error if you know the principles,

you can renew a memory from void and delete it completely like a miracle. (oops, is it in a blackhole?)

human brain is a higher-level computer,

I'd rather say that.

because each time I open my memory drawer,

the black and white Polaroid shows a new color.

memory in human brain is a living creature.

the weak baby will grow into a nymph with its wings stronger.

but to return to the good old days I need a trigger,

maybe that's why I call music the key to my memory drawer.

This key is definitely not like the other,

it only works for the speech recognition lock.

like ancient man will call it magic power.

but I won't regard anything as magic,

even human colonize the galaxy in an hour.

If there's one thing I have to treat as magic,

I would only say

the moment we thought our soul are connected to each other.

I like to sail on the endless sea of memory,

just to cheat myself that maybe one day,

I have the ability to borne back ceaselessly into the past.

see how human brain is perfect,

because I assume you almost forgot the topic.

all I was talking about is bullshit.

let's just forget about it.

oh

maybe you can make it,

but I fail to erase it,

only my brain can prove it.
